

Medium Voltage Fuses

British Standard

For Oil Insulated Switchgears

Medium-Voltage fuses for installation in oil insulated switchgear according to British Standard

▶ Introduction

Medium voltage fuse-links according to British Standard are back-up fuse-links for the protection of substations up to 24 kV.

The fuse-links of this section comply with the following national and international standards:

- IEC 60282-1
- BS 2692-1
- ESI 12-8

Design and construction of these fuse-links follow the well-proven concept of all SIBA high voltage fuse-links. For pressure resistant encapsulation, high grade ceramic is used. Contact material consists of silver plated high conductivity copper. The pure silver melting elements have appropriate notches to ensure small time-current curve tolerances and low let-through currents. The arc quenching quartz sand is subject to particular survey criteria regarding its composition, grain size and humidity content.

▶ Fuse-links for oil insulated switchgear

These fuse-links comply with the requirements for tightness under oil as well as special mechanical properties for use in oil filled switchgears. The fuse-links are fitted with a striker and are very useful in Fuse/Switch-combinations, which comply with the requirements of IEC 62271 part 105.

For installations of fuse-links in oil filled transformers please refer to section HHO of this catalogue.
